- First put water in the tank; add the SuperMix of your choice and stir well.
- In areas with "soft" water addition of Ca 15 when using the SuperMixes may be necessary. In that case always mix-in Ca 15 first, then add SuperMix.
- When using Nutri- or Coco Nova: first add A; stir well, add B and stir well again.
- Let the mix rest for an hour, then adjust pH to 5,8.
- The dosage of the main fertilizers may be raised \pm 15% if necessary.
- The last week before harvest only use water with additives, without fertilizers.

- When growing plants with a long flowering period that like the Haze SuperMix, the schedule may be prolonged as much as necessary.
- Triple the amount of Ca 15 when using Reverse Osmoses water.
- Vitrasol may be added to enhance the taste of consumable produce. In that case the dosage of the main fertilizer can be decreased with 10-25%.
- SprayMix can be applied to enhance the vitality of the treated plants. It can be used weekly till flowering occurs.
- Use BioRoots while planting or re-planting in a 1% solution. Repeat after 30 days. In stressful situations weekly repetition is advised.
